EUROFLEET

AN EFFICIENT FLEET MANAGEMENT TOOL FOR MANAGERS

CASE STUDY

PROJECT SUMMARY

Eurofleet is a mobile tool designeg for efficient fleet management. It provides information about each vehicle detailed parameteres, its location and route traveled.

Eurofleet app is a tailored car trackign solution, developed for Gannet Guard Systems, a security company from Poland.
The goal of this project was to create a complex web application to track stolen cars and alert users in some predefined situations. Ready4S was selected to develop the system after winning a competition among four Polish development agencies.

The app enables business users to analyse parameteres of connected vehicles and see their exact location on map in simple user-friendly way. It also sends immediate notifications in case of emergency situations that may occur on the road.

> "Ready4s performed very well. They are very talented, and I was lucky to find them since many other developers can't handle our mobile projects.

CLIENT'S OPINION

Background

Please describe your organization.

Gannet Guard Systems S.A. is engaged in tracking and recovery of stolen objects. The company has operated in Poland since 1997. Our roots come from Scandinavia. The GanTrack module is used to protect construction machinery, cars, boats, caravans, and containers.

What is your position?

I am project manager.

What business challange were you trying to adress with Ready4S?

We needed a tool designed for efficient fleet management that enables users to monitor the current vehicle location via GPS sensor mounted in each car as well as to analyze the parameters of the vehicles.

The application should provide the user information about the route traveled by the given vehicle and the duration of its stops.

In addition, the product needed to provide information in the form of graphs showing average and maximum speed, total mileage, and fuel level. It also needed to display events occurring during the use of the vehicle.

SOLUTION

Please describe the scope of their involvement in detail.

We needed to draw the essence of a web-based system, rich in functionality, and present the data in a clear way on the screen of a tablet and phone. Integration with the database that processes the telemetry data from sensors was a challenge, too. This was not an easy application to build on iOS or Android, so we needed a strong development team.

Please descrive the scope of their involvement in greater detail.

One of our business partners had recommended Ready4S, but we decided to test three other companies from Poland. Ready4S won the competition.

What is the status of this engagement?

Ready4S provided all of the following services: strategy, design, development, and testing. The comprehensive project took four months from start to finish.

We will start another phase of the project in 2016. The project is never completely finished since we want to add important functionalities this round.

Results & feedback

How did the Ready4S perform from a project management standpoint?

Our first priority is high quality. The application was delivered on time and within the stated budget. Ready4S performed very well. They are very talented, and I was lucky to find them since many other developers can't handle our mobile projects.

There were no bugs or problems with the mobile project. We are also satisfied with their support and testing outcomes.

I can also happily report that our customers enjoy our product and are using it successfully. Most clients just use the web application, but we also offer a paid mobile option that many customers utilize. Security industry customers love to have real-time information at their fingertips. The project was a huge success, so we will continue to work with Ready4S for the next round of work.
